

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

How is solar energy converted into electricity?

Solar energy is converted into electricity through the photovoltaic effect, a process where sunlight, composed of photons, agitates electrons in a semiconductor material (like silicon) within solar panels. Here's a deeper look into the full process: To find out how solar power works, you need to understand how panels are made.

Are solar panels putting out electricity?

The sun is always putting out energy, but how much electricity you actually get from your panels fluctuates based on several site-specific and environmental conditions. The optimal performance of a solar array is determined by its exposure to direct sunlight. Point panels true south (U.S. rule of thumb) to soak up sunlight from dawn to dusk.

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.
