Do ground-mounted photovoltaic (PV) modules have seismic performance?

Policies and ethics This paper presents the seismic performance of ground-mounted photovoltaic (PV) modules. The seismic performance of the PV module is evaluated for sets of near-field (NF) and far-field (FF) ground motion records.

How is the seismic performance of a PV module evaluated?

The seismic performance of the PV module is evaluated for sets of near-field (NF) and far-field (FF) ground motion records. The selected ground motions are matched to the target spectra in IS-1893 (Part-I):2016 for different soil conditions and seismic intensities. The varied capacity and supporting module systems are considered in the analysis.

How is seismic analysis done in a ground-mounted PV module?

The seismic analysis of the ground-mounted PV module is done for various seismic conditions. The NF and FF real ground motions are selected to perform the time history analysis. The desired ground motions are matched to the target spectra given in Indian Standard Code IS-1893:2016 (part 1).

Are solar panels earthquake-resistant?

For seismic design, analysis is relatively straightforward for positively attached systems to the ground or roof structure. This design methodology for assessing the structural adequacy of separate solar arrays under seismic load is studied. Earthquake-resistant construction is meant to safeguard PV systems from earthquakes.
