

China's 600 MW compressed air energy storage plant proves grid-scale power storage can scale without lithium or battery minerals.

Multi-day energy storage technologies, including iron-air batteries, could help pave the way for California to build a resilient, clean, and reliable grid.

The study offers a versatile strategy for advancing zinc-air batteries toward real-world applications, including grid-scale energy storage, wearable electronics, and solar-assisted power ...

Israeli company Augwind Energy is planning to build the world's first commercial-scale "air battery" in Germany, using underground salt caverns to store compressed air for electricity generation.

Researchers have designed a new lithium-air battery that can store much more energy per volume of battery than today's lithium-ion designs. The new battery uses a solid composite ...

Compressed air energy storage (CAES) is an effective solution for balancing this mismatch and therefore is suitable for use in future electrical systems to achieve a high penetration of ...

Our first commercial product is an iron-air battery system that can cost-effectively store and discharge energy for up to 100 hours. Unlike lithium-ion batteries, which can only provide energy for a few ...

Liquid air energy storage could be the lowest-cost solution for ensuring a reliable power supply on a future grid dominated by carbon-free yet intermittent energy sources, according to a new ...

An overlooked technology for nearly 50 years, the world's largest liquid air energy storage facility is finally set to power up in 2026.

As the world races toward carbon neutrality, these underground marvels - using compressed or liquid air - have emerged as game-changers in storing wind and solar power. Let's ...
