

Very low RH in very long-term film storage can cause the film to become brittle and crack or break during handling. Negatives, from which prints are to be made, stored at low RH may produce static ...

Proper film storage conditions are paramount to preserving photographic and cinematographic film for future generations. These conditions must meticulously control temperature ...

In most areas you can only pay one or two years in advance. Of course it's easy to have some agent paying for you. Lockers like in bus stations are cleared out on a periodic basis. Rather ...

Low storage temperatures are best, so long as the RH doesn't get above 60 percent, which can lead to fungus. To prevent moisture condensation, let the films warm to room ambient temperature before ...

Most films can be stored in the fridge for up to six months before processing without forming any noticeable defects. For cinema film, like Kodak Vision 3 500T, Kodak suggests keeping ...

In the absence of ideal storage conditions, films can still survive for decades as long as they are kept in a stable environment that is not too hot, too dry, or too wet. Find an area with stable ...

Film should ideally be stored at slightly different conditions than video and paper for its long-term survival. The Film Storage Vault at HD is 40°F, 30%RH (the other vaults at HD are 45°F, 35%RH).

Of the 33 wide-release films this summer, only "Oppenheimer" (Universal) and "Sound of Freedom" (Angel) remain in release after 60 days or more and have not announced home ...

I used one when I had a layover in NYC and put my suitcase in a locker so I could get out of the train station and wander. A better way for a small object is to mail it to a P.O. Box.

At all costs, avoid storing film in prolonged dampness. Under damp conditions, the film will stick together and mold may grow, ruining the emulsion. Damp locations such as basements or attic areas are ...
