

In this paper, PVTOM is applied to representative houses in select Canadian ...

This study investigates the integration of renewable energy sources into trigeneration systems that include desalination, with the goal of maximizing renewable energy utilization while ...

In this study, a novel trigeneration system is conceived to produce heat and electricity and to provide cooling for the health treatments and touristic facilities of a spa, based on the natural ...

The solar trigeneration system based on coupling photovoltaic thermal (PVT) collectors with an absorption-subcooled compression hybrid cooling configuration has the potential for ...

Photovoltaic systems work by utilizing solar cells to convert sunlight into electricity. These solar cells are made up of semiconductor materials, such as silicon, that absorb ...

Abstract The overall aim of this work is to assess the performance of high-efficiency solar trigeneration systems in order to fulfill an industrial complex heating and cooling demands. The ...

Trigeneration, also referred to as combined cooling, heat, and power (CCHP), enhances cogeneration by incorporating cooling, thereby improving overall efficiency. These systems can be powered by ...

Photovoltaic (PV) devices generate electricity directly from sunlight via an electronic process that occurs naturally in certain types of material, called semiconductors.

In this paper, PVTOM is applied to representative houses in select Canadian regions, which experience cooling loads, to assess the fuel utilization efficiency and reduction in greenhouse gas emissions ...

To make efficient use of low-potential thermal energy, a preliminary scheme of a combined cooling, heating, and power generation system based on metal hydride, operating on solar ...

Photovoltaics (PV) is the conversion of light into electricity using semiconducting materials that exhibit the photovoltaic effect, a phenomenon studied in physics, photochemistry, and ...

Photovoltaic (PV) technologies - more commonly known as solar panels - generate power using devices that absorb energy from sunlight and convert it into electrical energy through ...

The selection and matching of subsystems in the developed trigeneration system are based on their ability to complement each other in harnessing and converting solar energy efficiently.

Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat ...

Photovoltaics is one of the fastly growing technology whose applications demand the exact knowledge of solar insolation, its components and their exact changing behaviour over days ...

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into ...
