

Can solar sails be used for interstellar travel?

Empowering the world's citizens to advance space science and exploration. The Planetary Society's LightSail program demonstrated that solar sailing is a viable means of propulsion for small satellites. Solar sails use sunlight instead of rocket fuel for propulsion. They are one of the few technologies that could be used for interstellar travel.

What makes up the Solar System?

The solar system is our cosmic neighborhood, made up of the sun and everything that orbits it -- planets, moons, asteroids, comets, and even dust and gas.

Could a solar sail system help humanity become an interstellar species?

NASA's recent launch of a solar sail system could be the first step on humanity's journey to being an interstellar species.

What is interstellar travel?

Interstellar travel - the ability to move beyond our Solar System and out into the stars - has long been on humanity's bucket list, but until now it's been stumped by the seemingly insurmountable vastness of space. Our nearest star, Proxima Centauri, is a staggering 4.24 light-years away (40 trillion kilometres, or 25 trillion miles).

LightSail is a citizen-funded project from The Planetary Society to send a small spacecraft, propelled solely by sunlight, to Earth orbit.

The solar system, explained Our solar system is made up of the sun and all the amazing objects that travel around it.

Discover the order of planets in the solar system. From Mercury to Neptune, explore our solar system and learn more about our cosmic home.

Could this be humanity's first multi-generational starship to another solar system? By Jordan Joseph Earth staff writer Follow Earth on Google

With this student's guide to the solar system each aspect: the sun, moon, planets, asteroids are explained in detail in a way that students can relate to.

Solar sails represent one of the most promising and innovative propulsion systems for the future of space travel. While they are not yet capable of carrying humans, they offer a sustainable, ...

While current technology limits us to exploring the solar system, the dream of reaching distant star systems drives scientific innovation and imagination.

Solar system, assemblage consisting of the Sun and those bodies orbiting it: 8 planets with more than 400

known planetary satellites; many asteroids, some with their own satellites; ...

NASA's Solar System Interactive (also known as the Orrery) is a live look at the solar system, its planets, moons, comets, and asteroids, as well as ...

Second, and perhaps more devastatingly, solar storms can take out the navigational and communications systems of satellites themselves. This ...

Xplore's LightCraft(TM) In The News Solar Sailing to the Outer Solar System and Interstellar Travel The Solar Gravitational Lens will Map Exoplanets. Seriously. Imaging Exo-Earths with Slava ...

The solar system has one star, eight planets, five dwarf planets, at least 290 moons, more than 1.3 million asteroids, and about 3,900 comets.

To transport our planet across the universe, we would need to bring the whole solar system to sustain life on Earth - on this episode of Dead Planets Society, our hosts contemplate how ...

We can explore our solar system over reasonable timescales, but reaching the closest neighbouring star, Proxima Centauri, which is 4.2 light years away, would require a craft accelerated ...

Travel Times by Spacecraft Around the Solar System 3 Most science fiction stories often have spaceships with powerful, or exotic, rockets that can let space travelers visit the distant planets ...

NASA's recent launch of a solar sail system could be the first step on humanity's journey to being an interstellar species.
