

Can solar control valves overcome the challenges inherent in solar power production?

The first part will focus on how specially tailored control valves can overcome the challenges inherent in solar power production. Solar energy is a viable alternative to fossil fuels and nuclear power. It's safe, climate-friendly and plentiful, especially in the Earth's sun belt.

Can control valves be used in solar power applications?

This is the first in a two-part series exploring the selection of valves in solar power applications. The first part will focus on how specially tailored control valves can overcome the challenges inherent in solar power production. Solar energy is a viable alternative to fossil fuels and nuclear power.

Can solar power be used for valve actuation?

An important factor when considering solar power for valve actuation applications is the potential for leaks. If the equipment is not properly designed for the environment, operating conditions, and pressure and temperature cycling, hydraulic systems can leak. In addition, the fluid itself needs attention.

How does a solar-powered valve actuator work?

The hydraulic pressure is used to hold the valve open and compress a powerful, self-contained spring. If valve closure is required, hydraulic pressure is released and the spring quickly closes the valve, preventing further loss of product. These are just two examples of the hundreds of viable applications for solar-powered valve actuators.

The air vent valves and deaerators ensure systems operate with water that does not contain any air. They are therefore capable of absorbing - and then eliminating - bubbles and micro-bubbles of air ...
