

What is a 1 phase solar inverter?

1-phase inverters are designed for smaller systems with an output of up to around 10 kW. For larger solar systems that need to generate more electricity, they quickly reach their technical limits. If the energy requirement exceeds this range, single-phase inverters can no longer provide the power efficiently.

What is a single-phase inverter?

Single-phase inverters convert the direct current (DC) generated by solar modules into grid-compliant alternating current (AC). They are particularly suitable for smaller photovoltaic systems in private households or small commercial applications with an energy requirement of up to around 10 kW.

Can a single phase inverter be used in a 1 phase system?

The use of single-phase inverters in such environments can lead to overloads, power losses or inefficient operation. 1-phase systems only supply the grid via a single phase, which can lead to imbalances during higher load peaks and greater consumption.

Who should use a single-phase inverter?

Single-phase inverters are ideal for smaller solar systems, especially in private households. They are ideal for:
Private households: Single-family homes and small apartments with moderate power consumption. Small commercial enterprises: Offices, stores or workshops with manageable energy requirements.
