

The packaging method of photovoltaic panels purchased in Southern Xinjiang

Based on reports that up to 45% of polysilicon used in solar panels comes from Xinjiang, there is an emerging possibility that sanctions may be imposed on solar panels containing polysilicon from ...

This method allows near-continuous production of solar-grade polysilicon production, with new seed particles and gasses entering the reactor while grown particles and process gasses exit.

Solar panels assembled by an Indian company whose supply chain has links to Xinjiang-origin polysilicon continue to flow into the U.S. market despite a 2021 ban prohibiting the importation ...

The solar industry is not doing nearly enough to extricate itself from the Xinjiang despite the mounting evidence that its supply chains are enmeshed in these abuses, argues a new report ...

China's global share in all key manufacturing stages of solar panels is predicted to rise to 95% by 2025, with Xinjiang playing a major role. This poses both an ethical and strategic risk to ...

A bipartisan bill in Congress seeks to address Chinese forced labor by blocking imports of goods produced in Xinjiang, where most of the global supply of solar cells is manufactured. CSIS's ...

In northwestern Xinjiang Autonomous Region, the solar energy industry has a highly developed industrial chain from sourcing raw silicon materials to creating the photovoltaic panels.

Beijing has faced multiple accusations of using forced labour practices in solar panel manufacturing. Concerns have focused particularly on the Xinjiang region, where the Chinese ...

Four of the solar-related companies added to the ban in January are in Chinese provinces other than Xinjiang, but the US government believes they source polysilicon made with forced labour from there.

95% of solar panels worldwide are made up of polysilicon. Nearly half of global production comes from Xinjiang, where polysilicon is produced by Uyghurs and other Muslim minorities under conditions of ...
